                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated mucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vactor comprising a promoter operably linked to the nucleic acid containing the vector; (3) an isolated containing the vector; (3) an isolated containing the vector; (3) an isolated containing the vector; (3) an isolated containing the vector; (3) an isolated containing the vector; (3) an isolated containing the polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for child feration, or that inhibits cellular proliferation; (6) identifying a compound that inhibits cellular proliferation; (7) identifying a compound that inhibits cellular proliferation or the biological pathway in which a proliferation or required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of required for cellular proliferation in calls or a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation in calls or compensed to the transparent of an organism. The antisense nucleic acids required for proliferation in calls or cher than S. aureus, S. typhimuring drug discovery programs, or for screening homologous nucleic acids required for proliferation in calls or cellular sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence is encoded by one of the target prokaryotic essential genes.

Gene product of first ORF of virus capable of inducing viraemia in feline species encoded by clone 61E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding leukaemia virus-A sub:type - producing AIDS type disease in cats, used to test drugs and vaccines.
                                                                                                                                                                                                                                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or parameters, where plant sequences having an B-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                   Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a fusion protein, termed PFeLVp27-gp70611, between the C-terminus of feline leukemia virus (FeLV) Pr65-gag and FeLV glycoprotein 70. The fusion protein was produced in Becherichia coli cells transformed by a recombinant vector comprising nucleic acid nFeLVp27-gp701813 (see AAH27069). PFeLVp27-gp70611 is an example of a recombinant infectious agent antigen that can be used in the method of the invention to determine the immune status of an animal. The method involves contacting a biological specimen of an animal (cat, dog or horse) with a recombinant antigen, and detecting the presence or absence of a complex between the recombinant antigen and an antibody present in the sample. The method determines whether the animal is protected against disease or should be vaccinated. Recombinant antigens (see AAM50107-24), nucleic acids encoding them (see AAH27054-71), methods of producing them, and assay methods are provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                          Determining immune status or vaccination status of an animal to e.g. calcivirus comprises using a recombinant viral antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

Variant of viral genome induces immunodeficiency in cats similar to AIDS. May be used in research, especially in testing drugs and vaccines against vireamia and and feline leukaemia viruses. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 27-AUG-2003 to correct post on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The nucleocapsid protein (AAR94427) and envelope protein (AAR94428) sequences of feline leukaemia virus provirus F6A clone 61B were deduced from open reading frames identified in the proviral DNA (AAT13255). Clone 61E is replication competent and capable of inducing persistent viraemia in cats. Host cells, e.g. feline cells, can be transformed with DNA derived from 61E and used to produce infectious virus useful in vaccines, in the generation of viraemia and in disease challenge systems. polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded composed proteins (DITHP; ABR41136-ABR41812). The invention also relates to proteins (DITHP; ABR41136-ABR41812). The invention also relates to sequences of the invention; recombinant vectors, host cells and transgenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP proteins; antibodies specific for DITHP proteins; microarrays comprising dithp nucleic acid sequences; methods of detecting dithp nucleotide and protein sequences; methods of sessing the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP proteins may be used in the diagnosis of a wide variety of conditions including cancer and other cell conditions of a wide variety of conditions including cancer and other cell condisions of a wide variety of conditions including cancer and other cell condisions; hormonal disorders; metabolic viral, fungal or parasitic infections; hormonal disorders; metabolic disorders; metrological disorders; gastrointestinal disorders; unasport of screen for modulators of proteins can additionally be used in analysis of the proteome of a tissue correct and to induce antibodies. They may also be used to conditionally useful in somatic or garmline gene therapy of the disorders additionally useful in somatic or garmline gene therapy of the disorders mentioned above, as a source of antisense sequences as a source of antisense sequences as a source of university or the generation of transgenic animal models of human disease or knock in humanised animals, in toxicological testing, and in transcript imaging. The present sequence expression and primers and primer protein which has intracellular consignalling activity. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Carr GJ;

streptococcus/GBS (Streptococcus agalacties) or group A streptococcus/GAS (Streptococcus agalacties) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have entibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66644-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly. S. agalacties and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic used in gene therapy. Antibodies to (I) are used for affinity error. C. chronetography, immunoassays, and distinguishing/identifying
                        New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antiinflammatory; antibacterial; immunostimulant; auditory; respiratory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media cear infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                               The invention relates to a protein (ABP25413-ABP30895) from group B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ÷

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABU01601;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibicities, the essential genes their use in the discovery of novel antibicities, the essential genes their use in the discovery of novel antibicities, the essential genes is the message and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus auceus, Salmonella typhi, Klebsiella pheumoniae, Pseudomonsa areuginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the expressed proteins. The proteins can antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence: represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPO at the way obtained in the propertion of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fraser C;

Streptococcus promoniae type 4 strain genomic sequence appearing as Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the protein, CABS56454. Also included are an antibody which binds one of the protein, composition), a kit comprising first and second primers, which are the composition), a kit comprising first and second primers, which are the composition, a kit comprising first and second primers, which are the first primer is substantially complementary to the target sequence contained within a Streptococcus nucleic acid sequence. The first primer is substantially complementary to the complement of the target sequence and where the parts of the primers having cubstantial complementarity define the termini of the target sequence to substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the crocein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus contained and also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying commonian, such as pneumonia sequence. So the sequence data for this patent did not form part of the printed composition, but was obtained in electronic format directly from Wipo at Erp.wipo.int/pub/published\_pot\_sequence is one of the 2459 proteins expendence to the protein of the prote ó identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Gaps invention relates to a protein comprising or having at least 50% ٠, 0; Indels Length 87; DB 6; Score 7; DB 6; Pred. New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 74627; 1766pp; English.

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid propertied end; (2) an bost cell containing the vector; (3) an isolated only perfect acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway proliferation or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or that that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a conjunct is overexpressed or underexpressed; (12) determining the extent or organism; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The actions mucleic acids are useful for identifying proctains or screening for homologous mucleic acids required for proliferation in cills other than S. aurens, S. typhimurium, C. C. patent did not form part of the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence is a for this from wind, inhimitation of an organism or processed or a present and sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence is action of an electronic format directly from NIPO at the target prokaryotic essential genes or sequence is encoded by one of the target prokaryotic essential genes or sequence is encoded by one of the target prokaryotic essential genes or sequence is encoded by one of
                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid of the nucleic acid; (2) a host cell containing the vector; (3) an isolated contented or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide of specifically binding the polypeptide or its fragment whose expression is inhibiting cellular polyleration or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation; (8) inhibiting a gene required for cellular proliferation or the biological cortains again acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of an compound's activity; (11) a culture comprising strains in which the cortains or lidentifying the trains for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation of no recenting for homologous nucleic acids required for proliferation of no recenting for homologous nucleic acids required for proliferation or screening for homologous nucleic acids required for proliferation or screening for homologous nucleic acids are useful for required for proliferation or isolate candidate modeled by one of the target prokaryotic essential genes. Note: The sequence data for this patent will help present a specification, but when a patent of form pa

```
The invention relates to novel human secreted polypeptides. The polypeptides are useful for polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agomists and antagomists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the pulpeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used to proliferation; to regulate hemantopoiesis, and in bone, cartilage, tendon conflictation; as anti-inflammatory agents; and in treatment of leukaemias. AAU32910-AAU3304 represent the amino acid sequences of novel human construction.
                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
Human, vaccination, gene therapy, nutritional supplement, stem cell proliferation, haematopoiesis, nerve tissue regeneration; immune suppression; immune stimulation; anti-inflammatory; leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a polypeptide encoded by one of a large number of S' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the S' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                        Human, 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying a pents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic exids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation, as anti-inflammatory agents; and in treatment of leukaemias. AUC2910-AAU33104 represent the amino acid sequences of novel human secreted proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                        New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A. baumannii protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antinflammatory activity. (I), nucleic acids encoding (I), ABM66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Masignani V, Margarit Y RosI, Grandi G, Fraser C;

Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to longostion comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human intracellular signalling molecule INTSIG-4 protein SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human intracellular signaling molecules (INTSIG)), useful for diagnosing, treating and preventing diseases or conditions associated

                                                                                                                                                                                                                                                                                                                                                                                                                           18-JUN-
  The present invention describes human intracellular signalling molecules designated INTSIG-1 to INTSIG-52. The INTSIG polymucleotides and proteins have expostatic, antiatarteriosclerotic, antidabetic, anticonvulsant, noctropic, neuroprotective, cerebroprotective, anti-HIV, antiallargic, antiinflammatory and thyromimetic activities, and can be used in gene therapy. The INTSIG polymucleotides and proteins can be used in gene than any prevention of diseases or conditions associated with the decreased expression or overexpression of INTSIG, such as cell proliferative (e.g. cancer, atherosclerosis), endocrine (e.g. diabetes), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies), developmental (e.g. disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of INTSIG. The INTSIG or its fragments are useful in screening compounds the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide.

The present sequence represents human INTSIG-4 from the present
                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
 with the aberrant INTSIG expression e.g. cancer, diabetes, epilepsy, or infections.
                                                                                                                                                                                                                                                                                                             Gaps

```
The invention relates to an isolated polymucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP66902-ABP6849) are useful as molecular weight maxiers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellinative disorders (cancer), neurodegenerative diseases (Parkinson's or Albreimer's diseases,), autroimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, weight or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, uccers, liver or lung fibrosis, infections (Bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
```

```
This invention relates to novel DNA sequences which encode one of the Bacillus clausii secretion factors (SF) SecA, SecD, SecE, SecG, SecY, Ffh, FteY, SipS, SipT, SipV and SipW. In addition, the invention relates to novel transcription and sporulation genes in Bacillus clausii.

It is desirable that a production strain of Bacillus clausii should be deficient in sporulation, hence a greater understanding of this process is proposed by the identification of the genes of the invention. Gram positive microorganisms, such as members of the genus Bacillus, have been used for large-scale industrial fermentation their culture media. Ability to secrete their fermentation products into their culture media. Introducts into their culture media. Introducts in the secretion of properties by members of the genus Bacillus may be further composition or sporulation ferme Bacillus clausii that encode transcription or sporulation factors are used in recombinant expression or agricultural use, also in food, animal feed, cosmetics and cleaning compositions, typically enzymes, hormones and growth factors. Transformation or sporulation factors are used in transcription or sporulation factors are noced secretion, transcription or sporulation factors are both production and secretion of proteins have been secretion, transcription or sporulation with sequences that encode secretion, transcription or sporulation with sequences that encode secretion of proteins may increase both production and secretion of sporulation with sequences that encode secretion of sporulation factors may increase both production and secretion of proteins in Bacillus clausii sipV protein of the invention.
                                                                                                                                                                                                                                                                                                                                     secretion factor; SF; SecA; SecD; SecE; SecF; SecG; SecY; Ffh; FtsY; SipY; SipW; SipW; transcription gene; sporulation gene; sporulation deficient; Gram positive microorganism; Bacillus genus; large-scale industrial fermentation; fermentation product; sporulation factor; industrial protein; therapeutic protein; agricultural protein; food; animal feed; cosmetic; cleaning composition; enzyme; hormone; growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid from Bacillus clausii, useful for improving recombinant protein production, encodes secretion, transcription or sporulation factors, also encoded proteins.
                                                                                                                                                                                                                                                                                              Bacillus clausii SipV protein partial sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New D4 protein preferentially expressed in haematopoietic cells - for use as a diagnostic, in research and for treatment of leukaemia tumours, and
diagnosing e.g. cancer, osteoporosis, endometriosis, degenerative diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, cataracts restenosis, atherosclerosis, inflammation, skin disorders, glaucoma, obesity, muscular dystrophy, AIDS, infertility, cardiovascular disease, coagulation disease, ischaemia, hypertension, asthma, immune disease, pilepsy, angina, neurodegeneration, diabetes, anxiety, depression, schizophrenia, viral disease, gastric ulcers, stroke, Alzheimer's disease and as a contraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Differential screening of a subtractive hematopoietic cDNA library, yielded D4 cDNA, which encoded a protein that showed GDP-dissociation inhibitor activity. The cDNA sequence was determined (AAG-68115) and the amino acid sequence corresponding to the longest ORF was deduced (AAR-84112). Equivalent sequences for mouse D4 are given in AAG-8716 and AAR-5113. The cattle D4 protein sequence was also provided (AAR-54114). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polymucleotide, or its partial peptide, an antibody binding to the polypeptide or peptide of the polymucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide, or as a probe for detecting the polymucleotide. The olgonucleotide is useful as a primer for synthesising the polymucleotide, or as a probe for detecting the polymucleotide and encoded is useful as a primer for synthesising the polymucleotide, or as a probe for detecting the polymucleotide and encoded genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes may be included in them, signal transduction-related proteins, transcription-related proteins, disease related proteins and genes cancer the used as antidactors for diseases (e.g. osteoporosis, neurological diseases, cancer tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed sequence information supplied by the European Patent Office.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated gene sequence that is down-
capulated in the spinal cord in response to streptozocin-induced
diabetes, or comprising, hybridising or having at least 80% sequence
identity to a sequence whose expression products are kinases,
bhosphatases, ion channel proteins, receptors, transporters, G-protein
coupled receptor proteins, DNA-binding proteins, proceases or enzymes,
given in the specification. A gene of the invention has analgesic
activity, and may, have a use in gene therapy. The gene sequences, vector,
host cell, animal, polypeptide and antibody are useful for screening of
compounds for diagnosing or treating pain. The kits are useful for
simultaneous, separate or sequencial detecting and/or quantifying down-
regulation of a gene sequence in the spinal cord of a mammal in response
to streptozocin-induced diabetes. The compound or pharmaceutical
composition is useful as a medicament for treating or diagnosing pain.
The present sequence represents a protein encoded by a gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The present invention describes process and the factoring of the human malarial parasite, has modium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection (II) and polyclonal antisers or a monoclonal antibody raised to immediate comprising the sequences (II) are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum. Sequencing of the plasmodium chromosome 2 and the subsequent identification of proteins plasmodium chromosome 2 and the subsequent identification of proteins plasmodium chromosome 2 and the subsequent identification of proteins a process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the world, and there is a pressing need for vaccines and mosquitor resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and mosquitors are not specifically mentioned within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proteins and their fragments (I) encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alloiococcus otitidis, antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Proteins encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

```
This sequence represents ornithine cyclodeaminase (OCD) from Agrobacterium Ii plasmid pTiCS8. It shows approximately 30% homology with the Kangaroo eye lens protein mu-crystallin. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)
                                                                                                                                                                                                                                                                                                                                                               New mu-crystalline proteins - having ornithine cyclo-deaminase activity, used in diagnosis and treatment of disorders in ornithine metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiepileptic agents; antianxiety agents; hallucinogens; sedatives;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neuromuscular junctions; memory agents; Alzheimers disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated polymucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polymucleotide (I), its complement, degenerate variant or fragment; (3) a genetically engineared nost cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polypeptide that is comprised in the expression vector; (6) a pharmaceutical composition comprising the polypeptides of (1), their biological equivalent or fragment; (6) a pharmaceutical composition comprising the polypeptides of (1), their biological equivalent or fragment; (8) immunosing against Alloiococcus otitidis by administering to a host the immunishing against Alloiococcus otitidis by administering to a host the immunishing against Alloiococcus otitidis by administering to a host the immunishing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the containing the novel polymucleotides, in the biological sample, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by produce the polymucleotides, polypeptides, antibodies and compositions suitable to produce invention can be used for treating and diagnosing diseases, drug containing assays and monitoring of effects during drug clinical trials. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                               New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This sequence represents ornithine cyclodeaminase (OCD) from Agrobacterium Ti plasmid Ach5. It shows approximately 30% homology with the kangaroo eye lens protein mu-crystallin. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell contraining the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding
        mu-crystalline proteins - having ornithine cyclo-deaminase activity, in diagnosis and treatment of disorders in ornithine metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway cequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of product is overexpressed or underexpressed; (12) determining the extent of a compound is activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an host cell containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that has an activity against a biological pathway required for proliferation, or that thibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compund; activity, (11) a culture comprising strains in which the est compound that inhibits proliferation of an organism of the atrians is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids are useful for form proliferation in cells other than S. anreus, S. typhimurium, K. Eneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the present esquence is encoded by one of the patent of the form part of the present esquence as equence of the proper of the form part of the present of the sequence of the proper of the form part of the present of the sequence of the proper of the proper of the proper of the pr

WPI: 2002-759812/82 N-PSDB; ABZ12040 New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet or coagulation disorders.

Claim 9; SEQ ID NO 1870; 1012pp + Sequence Listing; English

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-RBZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The cancoded polypeptides (ABR689849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellimaging, screening and diagnostic assays and for treating cellimaging proliferative diseases (Parkinson's or Alzheimer's disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthitis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published pct sequences

Wall D,
Alloicoccus otitidis genomic DNA, which encodes an antigenic protein.
Alloicoccus otitidis is a Gram-positive bacterium. Also described: (1)
an isolated polypeptide that is encoded by the polymucleotide (1); its
an isolated polypeptide that is encoded by the polymucleotide (1); its
complement, degenerate variant or fragment; (3) a genetically engineered
composition vector comprising the novel isolated polymucleotide (1); its
composition comprising the polypeptide, its complement, biological
composition comprising the polypeptide, its complement, biological
composition comprising the polypeptide, its complement, biological
composition comprising the polypeptide, its complement, biological
composition vector; (6) a pharmaceutical composition comprising the
copypeptide of (1) and a carrier; (7) a protein chip comprising an array
of the polypeptides of (1), their biological equivalent or fragment;
composition; (9) detecting and/or identifying Alloicoccus
timunoganic composition; (9) detecting and/or identifying a host the
immunoganic composition; (9) detecting and/or identifying Alloicoccus
contidis in the biological sample; (10) a kit comprising a container
containing the novel polymucleotide, its degenerate variant or fragment,
or the antibody of (4); and (11) producing a polypeptide by culturing the
polymucleotides, polypeptides, and (11) producing a polypeptide by culturing the
polymucleotides are useful for expressing and compositions of the present
correling assays and monitoring of effects during drug clinical trials.
The polymucleotides are useful for expressing and detecting Alloicoccus
cutidis. The present sequence represents an Alloicoccus otitidis
cartigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô

```

```
the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contiferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for cequired for proliferation, (7) identifying a activity washinst a biological pathway captived for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of the biological pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibite the collular proliferation of an organism. The antisense nucleic acids are useful for identifying processing or screening for homologous nucleic acids required contains and second and second or the candidate molecules for acquired and second or the proper candidate molecules acids are useful for the collular propers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is enroded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained the mint in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biosynthesis; biodegradation; lactic bacterium; yogurt; cheese.

```
The invention relates to an instance in the invention where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promiter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the prolypeptide or the activity of a gene in an operor required for proliferation or the activity of a gene in an operor required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits or liferation of the proliferation or the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (1) a culture comprising strains in which the gene product is overexpressed for cellular proliferation of an organism. The antisense nucleic acids required for proliferation to isolate campions that inhibits the confidentifying proteins or screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, cellular proliferation in cells other than S. aureus, S. typhimurium, cellular proliferation in cells other than S. aureus, S. typhimurium, cellular proliferation in cells other than S. aureus, S. typhimurium, cellular proliferation in cells other than S. aureus, S. typhimurium, cellular proliferation of the present sequence as encedied for this sequence is enceded by one of the rarget prokaryotic essential genes. Note: The sequence data for this shad nor form part of the prince of the proliferation of security from MIPO at the sequence of 
                                                         New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..
                                                                                                                                                                                                                                                                                                                                                                                                  sequence (ABA90521) and related proteins (ABB53300-ABB5561). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify lactocoocus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zyskind JW;

                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                   ö
                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-regulated in specific cancers (e.g. about 1031 genes up-regulated or down-cute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer related gene nuclecities sequences which encode the proteins given in BABS 521 to ABRS 8709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid, (5) an antibody that specifically binds the polypeptide of 4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a crug screening assay. The nucleic acid is useful as diagnostic markers or therapetulic targets. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, and therases, prostate, skin and uterus), wounds, ischemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in a pathology acceening, particularly for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         o

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(I) a vector comprising a promoter operably linked to the nucleic acid concaining the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a gene in an operon required for proliferation, (8) identifying a gene required for the biological pathway in which a proliferation or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the extent to compound that inhibits the strains or (13) identifying the extent to be activity; (11) a culture comprising acids are useful for its continuous acts are useful for its continuous acts are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful for its continuous acids are useful.
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a fit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal compound that regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal compound that regulates the activity of one or more of the compound that regulates the activity of an enthod for identifying a compound or small molecule that regulates the activity of one or more of the compound that nethod for identifying a compound or small molecule that regulates the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides or their antibodies. The polymoclactice or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal companies of the propersection (shown in Table 2 of the specialication) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the pinal properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                             New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specification, but was obtained in electronic form directly from WIPO at tp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3.3%; Score 7; DB 7; Length 468;

The present invention describes an isolated polymuclectide (I) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a dram-positive bacterium. Also described: (I)
an isolated polypeptide that is encoded by the polymuclectide (I); (2) an isolated polypeptide that is encoded by the polymuclectide (I); (2) an isolated polypeptide that is encoded by the polymuclectide (I); (2) an expression vector comprising the novel isolated polymuclectide (I); (3) a genetically rengineared host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I); (5) an immunogenic equivalent or fragment, or the polypeptide that is comprising the comprising the polypeptide of (I) their bological equivalent or fragment; (I) and a carrier; (I) a protein chip comprising an array of the polypeptide of (I), their bological equivalent or fragment; (I) and a carrier; (I) a protein chip comprising an array of the polypeptides of (I); their bological sample; (II) a kit comprising a container containing the novel polymuclectide, its degenerate variant or fragment, or the antibody of (I); and (II) producing a polypeptide by culture. (I) can be used in gene therapy. The colypeptide from the culture. (I) can be used in gene therapy. The polymuclectides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug clinical trials. The present sequence represents an Alloiococcus otitidis otitidis. The present sequence represents an Alloiococcus otitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               L-arabinose isomerase; aldose; ketose; D-tagatose; beta-glycosidase; araA; L-ribulokinase; araB; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 476;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                 Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alloiococcus otitidis; antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection.

The present invention describes an isolated polymucleotide (I) of
Allolococcus otitidis genomic DNA, which encodes an antigenic protein.
Allolococcus otitidis is a Gram-positive bacterium. Also described. (1)
an isolated polypeptide that is encoded by the polymucleotide (I); (2) an
expression vector comprising the novel isolated polymucleotide (I); (1) an
complement, degenerate variant or fragment; (3) a genetically engineered
complement, degenerate variant or fragment; (3) a genetically regineered
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polymucleotide that is comprised in the
expression vector; (6) a pharmaceutical composition comprising the
cypreptide of (1) and a carrier; (7) a protein chip comprising the
cypreptides of (1), thair biological equivalent or fragment; (8)
immunising against Allolococcus otitidis by administering to a host the
containing the novel polymucleotide, its degenerate variant or fragment,
containing the novel polymucleotide, its degenerate variant or fragment,
cor the antibody of (4); and (11) producing a polypeptide by culturing the
correlative produce the culture. (1) can be used in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB57072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alloiococcus otitidis; antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                  The invention relates to an isolated L-arabinose isomerase active enzyme only derived from a Thermoanaerobacter sp. or its active fragment. The enzyme is is useful for converting an aldose into a ketose which involves contacting the aldose with (1), and keeping the reaction under conditions where at least 18 by weight of the aldose is converted. The aldose is chosen from L-arabinose, D-galactose and D-fucose, and the conversion reaction takes place at 60plusoc. The method further comprises the step of hydrolyzing lactose to obtain D-galactose by use of a lactase -active enzyme, where D-galactose is converted to D-tagatose. The lactase is immobilized and the isomerase enzyme preparation is immobilized, and where the lactose hydrolysis and the aldose isomerization takes place in the same reactor. The lactase-active enzyme is preferably beta-splaced and the Abpliance of the represent L-arabinose isomerase allows) is an actase-active enzyme is preferably beta-splaced and hydrolysis and the aldose isomerization takes place in the same seator. The lactase-active enzyme is preferably beta-splaced and hydrolysis and the aldose isomerization takes place in the lactase-active enzyme is preferably beta-splaced and hydrolysis and the preparent L-arabinose isomerase and hydrolysis and the aldose of comparison studies with a T.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

 compositions of the present
polynucleotides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The polynucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis antigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the encoded protein, derived from either a mouse or human origin.
Agonists or antagonists of the cytokine receptor 5J2368 can be used for the treatment and diagnosis of autoimmune, inflammatory and allergic diseases, as well as for treating the effects of septicaemia and for tumours. Accordingly, they can be described as having immunosuppressive, antiniflammatory, antiallergic and/ or cytostatic activity. This polypeptide sequence is the mouse class II cytokine receptor 5J2368 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Class II cytokine receptor SJ2368 and regulators of its activity and expression for treatment and diagnosis of autoimmune, inflammatory and allergic diseases and tumours.

This invention relates to a novel interferon (IFN) alpha/beta independent ligand receptor system that provides antiviral protection. Specifically, it refers to three genes located on chromosome 19, designated IFN-lambda2 and IFN-lambda3 that are expressed upon viral infection. These IFN-lambda proteins activate a specific receptor complex for signalling and induction of various biological activities, it consists of a novel receptor known as IFN-lambdaR1 (or CRF2-12, a class II cytoxine receptor family member) and a second subunit IL-10R2 (or CRF2-13, As such, the IFN-lambda compositions of the present invention can be described as cytostatic, virucidal, anti-microbial, hepatotropic and immunosuppressive. Accordingly, via gene therapy routes for example, they can be used to treat various infections and inflammations, as well as being useful for anti-cancer therapy, autoimmune, hyperproliferative, cardiovascular and neurological disorders. This polypeptide sequence is the mouse CRF2-12 protein, homologous to the human CRF2-12 receptor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mouse, IFN-lambdaR1, CRF2-12; interferon, IFN; alpha/beta independent, receptor; antiviral; IFN-lambda2; IFN-lambda2; IFN-lambda3; IL-10R2; CRF2-4; cytostatic; virucidal; anti-microbial; hepatotropic; immunosuppressive; gene therapy; infection; inflammation; anti-cancer; autoimmune; hyperproliferative; cardiovascular; neurological disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecule comprising a sequence that encodes the CRF2-12 polypeptide, useful for treating leukemias, myeloma, viral diseases, hepatitis, and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollowers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new polypeptide (NOVX). The NOVX oblypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX nucleic acids,

polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as cancers, Hodgkin disease, von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, tuberous sclerosis, ataxia palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telansy, celangiectasia, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, inflammatory bowel disease, athercoclerosis, hypertension, sclerating, immunodeficiencies, HVV, viral, bacterial or parasitic infertions, or graft-versus-host disease. The nucleic acids and colypeptides may also be used as targets for the identification of small molecules that modulate or inhabit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation pharmacogenomics. The present amino acid sequence represents a human NOVX protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                              ö

the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway complied product or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation of the gene product or that he test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a pack agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (10) profiling a compound, activity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of compound; activity in a compound for inclease acids required for proliferation of an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequence of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                                                                                                                                                  ö
                                                        The invention comprises the amino acid and coding sequences of mycobacterial (Mycobacterium tuberculosis) proteins which are upregulated under nutrient starving conditions and maintain mycobacterial latency. The DNA and protein sequences of the invention are useful for the treatment, DNA and diagnosis of a mycobacterial infection. The present amino acid sequence represents a Mycobacterium tuberculosis protein of the invention.

                                                        Polynucleotide sequence from acetobacter CDG operon - encodes cyclic
di:guanosine mono:phosphate degradation enzymes e.g. 3-phosphodiesterase
                                                                                                                                                           The amino acid sequence of protein PDEA2 was deduced from the 1st. open reading frame of the cdg2 operon. The protein is a diguanylate phosphodiesterase A, i.e. it enzymatically cleaves a single phosphodiester bond in c-di-GMP to yield the linear dimer pGpG. See also AAR88154. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequence from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                        .

The present invention describes an isolated polymucleotide (I) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
C Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1)
an isolated polypeptide that is encoded by the polymucleotide (I); (2) an isolated polypeptide that is encoded by the polymucleotide (I); (2) an isolated polypeptide that is encoded by the polymucleotide (I); its complement, degenerate variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide (its complement, biological equivalent or fragment, or the polypeptide (its comprising the polypeptides of (I), their biological equivalent or fragment; (6) a pharmaceutical composition comprising an array of the polypeptides of (I), their biological equivalent or fragment; (2) immunogenic composition; (9) detecting and/or identifying Alloiococcus oritidis in the biological sample, (10) a kit comprising a container contidis in the biological sample, (10) a kit comprising the containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the polypeptide from the culture. (I) can be used in gene therapy. The polypeptide from the culture. (I) can be used in gene therapy. The polypeptides, polypeptides, antibodies and compositions of the propure convention can be used for treating and diagnosing diseases, drug creening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid, (1) a host cell containing the vector; (3) an isolated or nucleic acid; (2) a host cell containing the vector; (3) an isolated or pulpaptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding celliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a bloogical pathway to appear required for that has an activity against a bloogical pathway in which a proliferation required gene or the biological pathway in which the test compound that inhibits cellular proliferation of an organism acts; (9) manufacturing an entibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene
                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
The polynucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis antigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zyskind JW;

product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel enterchaemorragic Escherichia coli
0157:H7-specific nucleic acid molecule. A polymucleotide of the invention
has anti-bacterial activity. The polypeptide can be used in detection
and/or treatment of 0157:H7 infection. The nucleotide sequence of the
genome of Enterohaemorragic E coli 0157:H7 was determined. The present
sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enterohaemorragic E. coli 0157:H7-specific protein SEQ ID NO: 1377.

The present invention describes an isolated mycobacterial peptide (I), or its fragment, variant or derivative encoded by a gene whose expression is induced or up-regulated during culture of a mycobacterium under continuous culture conditions of a dissolved oxygen tension of at least adissolved oxygen tension of up to 10% air saturation measured at 37 plus degrees Celsius when compared with a dissolved oxygen tension of up to 10% air saturation measured at 37 plus degrees Celsius when compared with the mycobacterial peptide (I) or its fragment, variant or variants or inhibitor, antibody, attenuated mycobacterium, attenuated microbial carrier, DNA sequence, DNA plasmid, RNA sequence, or RNA vector or from the present invention can be used for manufacturing a medicament for treating or preventing a mycobacterial infection. The peptide or its fragment, variant or derivative, the antibody, or a polymucleotide probe comparisant at least B nucleotides, where the probe binds to at least a part of the gene, is usefil for manufacturing a diagnostic reagent for wycobacterial infection. The present sequence represents a warmification of the resent invention amycobacterial antigen, which is used in the examinition of the resent invention and the reasont invention and the reasont invention and a sequence represents a seminification of the reasont invention and the reasont invention and the reasont invention and the reasont interest and the reasont interest and the reasont invention and the reasont interest and the reasont invention and the reasont invention and the reasont invention and the reasont interest and the reasont invention and the reasont invention of the reasont invention and the reasont invention and the reasont invention and the reasont invention and the reasont invention and the reasont invention and the reasont invention and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reason and the reas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated mycobacterial peptide encoded by a gene that is induced or up-regulated under high oxygen tension, useful for diagnosing, treating or preventing a mycobacterial infection.
                                                                                                                                                                                     Mycobacterium tuberculosis, mycobacterial, antigen; infection, vaccine, tuberculostatic; mycobacterial peptide; mycobacterial infection.
                                                                                                                                   Mycobacterium tuberculosis mycobacterial antigen protein SEQ ID NO:11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC6010-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note it he sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                               or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps
                                          New isolated protein complexes useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel enterchaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the inventi has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterchaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7 was determined the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                       Enterohaemorragic E. coli 0157:H7-specific protein SEQ ID NO: 1410.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kruse UD, Kuester BD;

Voltage sensitive cell, VSC; adhesion molecule, binding molecule; neuron; neurite promoting domain, hybrid electrical device, electrical junction; transistor; artificial chemical synapse.
cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hybrid electrical device with biological components that provide an

The invention relates to a nitrile hydratase which acts on the nitrile group of a nitrile compound, hydrates the nitrile group and converts it complex consisting of the alpha and beta subunits which act on a nitrile complex consisting of the alpha and beta subunits which act on a nitrile group of a nitrile compound, hydrate the nitrile group and covert it to an amide group, and use 2-hydroxy-4-methylthobutyronitrile as a cubstrate to produce 2-hydroxy-4-methylthobutyronitrile as a cubstrate to produce 2-hydroxy-4-methylthobutyronitrile as a containing either or both polymucleotides, a transformed host containing the vector, producing an amide (comprising contacting a nitrile compound with the hydratase or a microorganism producing it, or their processed products and recovering the amide produced and stabilising the activity of nitrile hydratase in the presence of nitrile compounds, compraining contacting the nitrile hydratase with divalent companies. The nitrile hydratase in the presence of nitrile metal cations. The nitrile hydratase, or transformed host is useful for producing an amide which involves contacting a nitrile compound such as alpha-hydroxy- nitrile with the enzymatically active
                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                produced. The alpha-hydroxynitrile is represented by formula P1, and the product alpha-hydroxynitrile is represented by formula P1, and the product alpha-hydroxy amide is represented by formula F3 (both detailed in the specification). The present sequence represents a peptide from Rhodococcus rhodochrous strain J1 nitrile hydratase beta subunit used to design a PCR primer for isolation of the DNA encoding Rhodococcus sp. Cr4 nitrile hydratase. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nitrile hydratase which acts on nitrile group of nitrile compound, hydrates nitrile group and converts it to amide group, useful for producing amides using alpha-hydroxy nitrile as starting material.
                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             material and recovering the amide (preferably alpha-hydroxy amide)
                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nitrile hydratase, beta subunit; enzyme; amide production, cyanide resistance, 2-hydroxy-4-methylthiobutyronitrile, 2-hydroxy-4-methylthiobutyroamide; alpha-hydroxy amide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R. rhodochrous nitrile hydratase beta subunit peptide #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a hybrid electrical device with biological components that provide an artificial chemical synapse. An electrical junction (1) between one transistor and at last 1 voltage-sensitive cell (VSC) characterised by at least 1 of the features selected from: (i) voltage transfer between the transistor and the VSC is bidirectional, (ii) there is no DC bias between the transistor and the solution containing the VSC; (iii) the VSC is anchored to the external surface of the transistor by binding moieties, optionally through spacers; and/or (iv) the voltage transistor, and between the external surface of the transistor and the membrane of the VSC and the external surface of the transistor, and between the external surface of the transistor. As an artificial chemical synapse i.e. a junction between a cell (which secretes an agent) and a transistor changes an electrical property of the transistor. The present sequence changes an electrical property of the transistor. The present sequence a VSC adheaion molecule, where the VSC is a neuron, which is used in an example from the present invention

The present invention relates to methods and compositions for the screening, diagnosis or prognosis of Alzheimer's disease (AD) in a subject. The method comprises analysing a sample of brain tissue from a cubject by 2D electrophoresis to generate a 2D array of Alzheimer's disease-associated features (ADFs), whose relative abundance correlates with the presence, stage or severity of AD and comparing the abundance of each feature with the abundance of that chosen feature in brain tissue from persons free from AD. The invention also describes Alzheimer's disease-associated protein isoforms (ADPIs) detectable in brain tissue in the methods and compositions of the invention are useful for the screening, diagnosis or prognosis of AD in a subject, for dentifying a correct subject having AD. Antibodies capable of therapy administered to a subject having AD. Antibodies capable of binding to ADPIS are useful for treating or preventing AD, and for determining the effect of therapy administered to a subject having AD. Antibodies capable of binding to efficacy of a given treatment regime. An agent that modulates the cativity of ADPI is useful in the manufacture of a medicament for the treatment or prevention of AD in a subject. ABG67292-ABG68038 represent human ADPI tryptic digest peptides
                                                                                                                                                                                                                                                                                                                                                         Screening, diagnosis or prognosis of Alzheimer's disease in subject, comprises detecting Alzheimer disease-associated features or Alzheimer disease-associated protein isoforms in brain tissue from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombospondin-1; mouse; rat; human; chicken; tumour cell migration; cell adhesion; platelet aggregation; wound healing; laminin; TS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to a method of screening or diagnosing Alzheimer's disease in a subject. The method is useful for screening, diagnosis or prognosis of Alzheimer's disease in a subject for determining the stage of severity of Alzheimer's disease in a subject for identifying a subject at risk of developing Alzheimer's disease, or for monitoring the effect of therapy administered to a subject having Alzheimer's disease. The method is also useful in treating vascular dementia, lewy body dementia, schizohrenia, Parkinson's disease, multiple sclerosis or depression. The inventive method identifies sensitive and specific blomarkers for the diagnosis of Alzheimer's disease in living subjects. It provides therapeutic agents for Alzheimer's disease that works quickly, optently, specifically with fewer side effects. The present sequence represents the amino acid sequence of a Alzheimer's diseaserassociated protein isoform tryptic peptide.

                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel peptide that binds to the thrombospoodin 1 is a protein which acts to promote cell adhesion and is involved in platelet aggregation, wound healing and tumour cell migration. Also disclosed in the invention is Laminin peptides which have been shown to be able to substitute for TS motif vwm and are useful as probe sequences in a computer search of all available databases for similar receptor binding motif peptides. The present sequence represents a thrombospondin-1 (TS-1) or Laminin cell binding domain peptide of the invention
                                                                                                                                                                                                                                                   Novel peptide that binds to thrombospondin 1 receptor, useful as probe sequence in computer search of all available databases.

```
This sequence is a fragment of the rat phospholipase Al (PLA1) of the invention. PLA1 is capable of hydrolysing phosphatidyl-serine, and has substrate specificity for serine phospholipids
                                                                                                                                                                                                                                         Phospholipase A1; phosphatidyl-serine hydrolysis; serine phospholipid;
PLA1; enzyme; rat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phospholipase Al and nucleic acid coding for it - having substrate specificity against serine phospholipid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10
/note= "unspecified amino acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                        Location/Qualifiers

This sequence represents an immunogenic portion of a Mycobacterium tuberculosis antigen of the invention. The polypeptides are useful for immunotherapy to treat or prevent tuberculosis (especially in humans), e.g. they can be included with an acceptable carrier in pharmaceutical compositions or included with an acceptable carrier in pharmaceutical protective immunity in a patient against M. tuberculosis. Tuberculosis a chronic, infectious disease generally caused by M. tuberculosis is complications and death. Reason proteins containing the antigen, or DNA molecules can similarly be included with an acceptable carrier in pharmaceutical compositions or in vaccines and administered as above. The polypeptides are also useful for diagnosis of tuberculosis, by contacting dermal cells with at least one polypeptide and detecting an immune response (especially induration) on the patient 's skin. Inhibiting the artiblocic therapy may not be effective due to the existence of an asymptomatic but contagious stage and to patient non-compliance. The polypeptides overcome concerns of safety and efficacy of current vaccination with live bacteria (usually Bacillus Calmette-Guerin) and lack of sensitivity and specificity of existing diagnostic techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigen; M.tuberculosis protein; immunotherapy; tuberculosis; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated Mycobacterium tuberculosis antigens - used to develop products for the prevention, treatment and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2.8%; Score 6; DB 2; Length 15;

```
This sequence represents an immunogenic portion of a Mycobacterium tuberculosis antigen of the invention. The polypeptides are useful for immunotherapy to treat or prevent tuberculosis (especially in humans), e.g. they can be included with an acceptable carrier in pharmaceutical compositions or included in vaccines, and administered to induce protective immunity in a patient against M. tuberculosis. Tuberculosis is a chronic, infectious disease generally caused by M. tuberculosis is complications and death. Pushing the artigon, and if left untreated typically results in serious complications and death. Pushing containing the artigon or DNA molecules can similarly be included with an acceptable carrier in pharmaceutical compositions or in vaccines and administered as above. The polypeptides are also useful for diagnosis of tuberculosis, by contacting dermal cells with at least one polypeptide and detecting an immune response (especially induration) on the patient, sixin. Inhibiting the spruppetides and of tuberculosis, since antibiocit therapy may not be effective due to the existence of an artibiocit therapy may not be effective due to the existence of an asymptomatic but contagious stage and to patient non-compliance. The polypeptides overcome concerns of safety and efficacy of current vaccination with live bacteria (usually Bacillus Galmette-Guerin) and vaccination with live bacteria (usually Bacillus Galmette-Guerin) and contacting diagnostic techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Mycobacterium tuberculosis.

WO9853075-A2

M. tuberculosis antigen clone ORF-2 peptide 2-25.

```
This sequence represents an immunogenic portion of a Mycobacterium tuberculosis antigen of the invention. The polypeptides are useful for immunotherapy to treat or prevent tuberculosis (especially in humans), e.g. they can be included with an acceptable carrier in pharmaceutical compositions or included in vaccines, and administered to induce protective immunity in a patient against M. tuberculosis. Tuberculosis as a chronic, infectious disease generally caused by M. tuberculosis in infection, and if left untreated typically results in serious complications and death. Fusion proteins containing the antigen, or DNA molecules can similarly be included with an acceptable carrier in polypeptides are also useful for diagnosis of tuberculosis, by contacting dermal cells with at least one polypeptide and detecting an immune specially induration) on the patient's skin. Inhibiting the spread of tuberculosis requires vaccination and accurate diagnosis, since antibiotic therapy may not be effective due to the existence of an arribiotic but contagious stage and to patient non-compliance. The polypeptides overcome concerns of safety and efficacy of current vaccination with live bacterial (usually Bacillus Calmette-Guerin) and lack of sensitivity and specificity of existing diagnostic techniques
                                                                                                                                                   Antigen; M. tuberculosis protein; immunotherapy; tuberculosis; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide comprising immunogenic Mycobacterium tuberculosis antigen useful for immunisation against M. tuberculosis infection to treat or prevent tuberculosis, and in diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB 2; Length 15; 1.7e+02; ches 0; Indels

This sequence represents an immunogenic portion of a Mycobacterium tuberculosis antigen of the invention. The polypeptides are useful for immunotherapy to treat or prevent tuberculosis (especially in humans), e.g. they can be included with an acceptable carrier in pharmaceutical compositions or included in vaccines, and administered to induce compositions or included in vaccines, and administered to induce protective immunity in a patient against M. tuberculosis. Tuberculosis is a chronic, infectious disease generally caused by M. tuberculosis is complications and death. Fusion proteins containing the antigen, or DNA complications and death. Fusion proteins containing the antigen, or DNA collecules can similarly be included with an acceptable carrier in polypeptides are also useful for diagnosis of tuberculosis, by contacting dermal cells with at least one polypeptide and detecting an immune spread of tuberculosis requires vaccination and accurate diagnosis, since antibiotic therapy may not be effective due to the existence of an especially induration) on the patient existence of antibiotic therapy may not be effective due to the existence of antibiotic therapy may not be effective due to the existence of antibiotic therapy may not be effective due to the existence of antibiotic therapy may not be effective due to the existence of an eryphophides overcome concerns of safety and efficacy of current vaccination with live bacteria (usually Bacillus Calmette-Guerin) and lack of sensitivity and specificity of existing diagnostic techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tuberculosis; Mycobacterium infection; gene therapy; anti bacterial;

The present invention relates to the isolation of Mycobacterium tuberculosis antigen polypeptides (e.g. TD224) and the nucleic acids cucoding them. The invention describes compounds and methods for the diagnosis of tuberculosis or for inducing protective immunity against tuberculosis. The compounds compise at least one immunogenic portion of one or more Mycobacterium proteins and nucleic acid molecules encoding them can be used in diagnostic kits for the detection of mycobacterium infection in patients and biological samples. The compounds of the invention and antibodies directed against the Mycobacterium completerium and antibodies directed against the Mycobacterium infections. The nucleic acids encoding the Mycobacterium proteins may be used in vaccines for immunisation against Mycobacterium infections. The nucleic acids encoding the Mycobacterium proteins may be used in gene therapy. AAU08159-AAU08188 represent peptides (ORF-2-1 to ORF-2-30) which overlap to the open reading frame ORF-2
                                                                                                                                                                                                                                                                                                                  An isolated polypeptide comprising a Mycobacterium antigen, e.g., from Mycobacterium tuberculosis, useful in a vaccine for enhancing an immune response to and inhibiting development of a Mycobacterium infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tuberculosis, Mycobacterium infection; gene therapy, anti bacterial; immunostimulant; mutant; mutein; ORF-2-23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mycobacterium tuberculosis overlapping peptide ORF-2-23.

The present invention relates to the isolation of Mycobacterium tuberculosis antigen polypeptides (e.g. Tb224) and the nucleic acids encoding them. The invention describes compounds and methods for the diagnosis of tuberculosis or for inducing protective immunity against tuberculosis. The compounds comprise at least one immunogenic portion of cone or more Mycobacterium proteins and nucleic acid molecules encoding such polypeptides. The Mycobacterium proteins and nucleic acid molecules encoding them can be used in diagnostic kits for the detection of Mycobacterium infection in patients and biological samples. The compounds of the invention and antibodies directed against the Mycobacterium proteins may be used in vaccines for immunisation against Mycobacterium proteins may be used in vaccines for immunisation against Mycobacterium cused in gene therapy. Auto8159-AM08188 represent peptides (ORF-2-1 to ORF-2-30) which overlap to the open reading frame ORF-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of laminin fragment and tissue plasminogen activator - for treating and preventing blood clots and embolisms.
                                                                                                                                   An isolated polypeptide comprising a Mycobacterium antigen, e.g., from Mycobacterium tuberculosis, useful in a vaccine for enhancing an immune response to and inhibiting development of a Mycobacterium infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This laminin-derived peptide contains the pentapeptide motif IXVAV, an adhesive sequence from the laminin A-chain which is known to increase in furro adhesiveness of mast cells. The sequence is a preferred biological function domain for peptides of the invention. In addition to a biological function domain, the peptides contain a metal ion binding domain (the N-terminal Cys residue in AAR44034) and are labelled with a metal ion such as Technetium (esp. 99mTc). Peptides comprising IXVAV are
                The peptide is a laminin fragment comprising residues 2091-2108 of huma laminin with an additional Cys residue at the N-terminus. The peptide i capable of activating tissue plasminogen activator and may used in a compsn. with tPA for the prevention and treatment of blood clots and embolisms. See also AAR25845-50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAR92739-41 are peptides which were used in the method of the invention to control the distribution of cells within a bioartificial organ (BAO). These peptides have been particularly useful in promoting cellular attachment. These peptides are pref. bound to the membrane of the BAO which is a biocompatible, permselective jacket. These peptides act to control the distribution of the core of living cells included in the BAO after in vivo implantation. BAO are used therapeutically to produce e.g. neurotransmitters, hormones, cytokines, growth factors, enzymes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Controlling distribution of cells in bio-artificial organs - e.g. by treatment of cells, or growth surfaces, to inhibit proliferation, promote differentiation or modulate adhesion, for in vivo prodn. of hormones, neuro-transmitter(s) etc.
useful for lung imaging, e.g. to localise primary or metastatic cancer tumours (photon-abundant) or to monitor emphysema or fibrosis (photon-deficient). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Control; distribution; bioartificial organ; BAO; cellular attachment; neurotransmitter; hormone; cytokine; growth factor; enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a fragment of laminin A, and can be used in the article of the invention. The article is a biodegradable and biocompatible article that comprises a surface and a biologically active ligand (BAL) (such as this sequence) provided on the surface in a spatially controlled pattern, where the BAL is attached to the surface by a specific molecular interaction. The articles may be used as tissue engineering templates in vivo or in vitro. They can be used in the manufacture of a medicament or device for the treatment of a patient in need of tissue regeneration or of a tissue engineering template, e.g. nerve regeneration, endothelial cell growth, vasculogenesis or wound repair. The methods can provide for the generation of micron-scale biocompatible article surfaces. A very wide range of pattern designs may be formed using this technology
                                                                                                                                                                                                                                                                                                                                                                                                                            New biodegradable and biocompatible articles having a patterned array of attached ligands, used for tissue regeneration or tissue engineering.
                                                                                                                                                                     BAL; biodegradable; biocompatible article; biologically active ligand; tissue engineering template; tissue regeneration; nerve regeneration; endothelial cell growth; vasculogenesis; wound repair; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2.8%; Score 6; DB 2; Length 19;

(50-5000 mm) which is stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution with an alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the method nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute amore closely controlled agent for in vivo administration, with greater ease of clearance from the body after their period of usefulness.

Controlling distribution of cells within a bioartificial organ useful for delivering a biologically active molecule involves exposing the cells to a treatment that inhibits or promotes cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for controlling distribution of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cells within a bioartificial organ. The method involves exposing the cells to a treatment that inhibits cell proliferation or promotes cell differentiation. The treatment is effective upon in vivo implantation in a host. The treatment of the method involves suspending the cells in a hydrogel matrix within the bioartifical organ, the matrix being derivatised with a proliferation-inhibiting or differentiation-inducing peptide. The present sequence is one such peptide, which also promotes cellular attachment. The present peptide recognises a cell surface receptor molecule involved in cell adhesion
                                                                                                                                                                                                                                                                                                                         Hammang JP, Holland LM;

ઠ 임 Biomedical device, chemical surface pattern, substrate, prepattern, applied molecular self-assembly system; prefabricated pattern, cell-adhesive pattern; ligand, cell type, cell membrane receptor, analyte determination; biological sensing platform; bioanalytical sensing platform.

Unidentified

Peptide #6 useful in cell-adhesive pattern for a biomedical device.

(first entry)

11-JUL-2003

ABU90762;

ABU90762 standard, peptide, 19 AA.

The present invention relates to a device with chemical surface patterns with biochemical or biological relevance on substrates with prepatterns of at least two types of regions (alpha, beta), where at least two different, consecutively applied molecular self-assembly systems are used such that at least one of the applied assembly systems is specific to one type of the prefabricated patterns. The prefabricated patterns may comprise cell-adhesive patterns that contain specific ligands such as peptides, proteins and antibodies that are used to interact with specific cell type (8) or specific cell membrane receptor(8). The invention also discloses a method for the simultaneous qualitative or quantitative measurement areas on a biological sensing platform. The device is useful for a bioanalytical sensing platform. The device is useful for a bioanalytical sensing platform. The device is useful peptides that may be used in cell-adhesive patterns for a device of the

Chemical surface patterns containing device for bioanalytical sensing platform, includes prepatterns of regions, and consecutively applied molecular self-assembly systems.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

Squence 2, Application US/08553336A

Squence 2, Application US/08553336A

Statent No. 6413738

GENERAL INFORMATION:

APPLICANT: Wayne R. Thomas and Kaw-Yan Chua

APPLICANT: Wayne R. Thomas and Kaw-Yan Chua

TITLE OF INVENTION: Allergenic Proteins and Peptides From

TITLE OF INVENTION: Allergenic Proteins and Peptides From

TITLE OF INVENTION: Allergenic Proteins and Uses Therefor

NUMBER OF SQUENCES: 15

COURSPONDENCE ADDRESS:

ADDRESSEE: LAHIVE & COCKFIELD, LLP

STREET: 28 State Street

CITY: Boston

COUNTRY: USA
GENERAL INFORMATION:
APPLICANT: Thomas, Wayne R.
APPLICANT: Thomas, Kaw-Yan
APPLICANT: Chua, Kaw-Yan
ITILE OF INVENTION: Allergenic Protein and Peptides From
ITILE OF INVENTION: House Dust Mite and Uses Therefor
ITILE OF INVENTION: House Dust Mite and Uses Therefor
OCRESPONDENCE: Cockfield

Sequence 200 3657 Application US/09540236

Patent No. 6673910

GRNERAL INFORMATION:

APPLICANT: GATY L. Breton et al.

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/540,236

CURRENT FILING DATE: 2000-04-04

SEQ ID NO 3615

LENGTH: 381
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J.
TITLE OF INVENTION: ALBERDIEL ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ALBERDIENCES 107196.1136
FILER REFERENCE: 107196.1136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
SEQ ID NOS: 33142
SEQ ID NOS: 2215
LENGTH: 293
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

Sequence 31, Application US/08029333

Patent No. 539967

GENERAL INFORMATION:

APPLICANT: Frazier, William A.

APPLICANT: Kosfeld, Minh D.

TITLE OF INVENTION: Thrombospondin Receptor Binding Peptides

NUMBER OF SEQUENCES: 47

CORRESPONDENCE ADDRESS:

ADDRESSEE: 800 N. Lindbergh Blvd.
                                                                                                                                                                                                                                                                                                                                                                                                                Length 752;

US-US-13-1-420-13.

US-US-13-1-420-13.

Patent No. 646913

GENERAL INFORMATION:

TILLS OF INVENTION: William A.

TILL OF INVENTION: Thrombospondin Receptor Binding Peptides

NUMBER OF SECURICES:

ADDRESSEE: SCOLE J. Meyer, Monsanto Co., A3SG

STREET: 800 N. Lindbergh Blvd.

CITY: St. Louis

STATE: Missouri

CONNTR: USA

ZIP: 63167

COMPUTER READALE FORM:

MEDIUM TYPE: Floppy disk

CORRESPONDENT SYSTEM: DCOMPATE: DADPY disk

CONFATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PATENTIN Release #1.0, Version #1.25

CURRENT APPLICATION DATE:

FILING DATE: 21-Feb-1995

FILING DATE: 21-Feb-1995

DOTOR ADDITORYTON NUMBER: US/08/391,820
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;

Patent No. 5696229
GENERAL INFORMATION:
APPLICANT: MATTER, Michelle L
APPLICANT: CHEN, Lanlin
APPLICANT: CHEN, Lanlin
TITLE OF INVENTION: AND MORPPOGENESIS ACTIVITY
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: OBLON, SPIVAK, MCCLELLAND, MAIER & NEUSTADT
         APPLICANT: LAURIE, Gordon W
APPLICANT: MATTER, Michelle L
APPLICANT: MATTER, Michelle L
APPLICANT: CHEN, Lanlin
TITLE OF INVENTION: POLYPEPTIDE WITH LAMININ CELL ADHESION
TITLE OF INVENTION: AND MORHPOGENESIS ACTIVITY
NUMBER OF SEQUENCES: 43
CORRESPONDENCE ADDRESS:
ADDRESSE: OBLON, SPIVAK, MCCLELLAND, MAIER & NEUSTADT
STREET: 175 S. JEFFERSON DAVIS HWY, SUITE 400
